WHAT'S THE RIGHT MIX?

60% Diesel : 40% Gasoline
More diesel at high ambient temperatures reduces gasoline flare-ups and extends burn time.
Pre-mix 2 gallons of gas to 3 gallons of diesel in 5 gallon tank, use this to fill drip torch.

Tips

Fill Line
Leave at least 1/4 inch space at the top of the can to allow room for fuel expansion when heated. More space is better.

Air Valve
Adjust the air valve to allow more or less air into the can, thereby adjusting the flow rate of your torch mix coming from the wick.

Adjustments
Adjust drip torch mix according to burning conditions and fuel types/condition in the burn block.

Why Mix?

Gasoline
Helps carry the flame from the drip torch to the ground.

Diesel
Provides a longer, residual burn time.
